## Abstract

A method for detecting the presence of a prescribed heat exchanger (2), in particular a catalytically active radiator in a motor vehicle, comprising the method steps, during operation of the motor vehicle, of observing a temperature of a heat-exchanger medium and time observing further current at the same operationally relevant parameters (21) of the motor vehicle for a prespecified time window (tf), detecting an expected temperature gradient over time of temperature of the heat-exchanger medium, detecting the temperature gradient over time the current temperature of the heat-exchanger medium, and detecting the presence of a prescribed heat exchanger (2) taking into account the expected temperature gradient and the current temperature gradient, and also apparatus for this purpose.
